1 INTRODUCTION

This document is the EGNOS Services Monthly Performance Report for October 2025. The public issues of the EGNOS Services “Service Definition Documents” ([RD-1], [RD-2], [RD-3], [RD-4]) are the reference documents for the present performance report.

This document reports on the EGNOS Services performance parameters with respect to the performance specified in the SDDs.

The document comprises the following sections:

Section 1: Is an introduction to this report.

Section 2: Provides an executive summary of the achieved performance.

Section 3: Presents the EGNOS SiS availability.

Section 4: Presents the performance of the EGNOS Open Service.

Section 5: Presents the performance of the Safety-of-Life Service for aviation.

Section 6: Presents the performance of the EGNOS Data Access Service.

Section 7: Presents the performance of the EGNOS Time Service.

Section 8: Lists the reference documents.

The document is completed by annexes:

- Annex A provides additional information on the monitoring network.
- Annex B provides the EGNOS APV-I Performance at airports.
- Annex C provides the EGNOS LPV-200 Performance at airports.
- Annex D provides list of acronyms.

2 EXECUTIVE SUMMARY

This report presents the EGNOS services performance during October 2025. The report contains global results for the reported period, including maps and tables with the performance observed at different locations in Europe using GEO-combined values for EGNOS operational GEOs. A list of the stations analysed in this report, including their location, can be found in Annex A . Additional and more detailed information about EGNOS performance can be found at the EGNOS User Support website (<https://egnos.gsc-europa.eu>).

During the month of October, EGNOS SoL and OS Services were impacted by a total loss of SiS occurring on Monday, 13 October 2025. EGNOS OS was recovered later that day, and EGNOS SoL was recovered on Friday, 17 October 2025 ([EGNOS SN #35](#)). To ensure that SoL sections reflect the real EGNOS performance during the remaining days of the month, these five days have been excluded from all analyses and figures reporting monthly results.

Safety of Life Service (SoL)

The percentage¹ of ECAC landmasses covered by APV-I and LPV200 Availability (99%) performance was 100% for APV-I (section 5.2.1) and 99.81% for LPV200 (section 5.3.1)². The achieved coverage for Continuity ($5 \times 10^{-4}/15s$) against the SDD commitment was 99.43% for APV-I (section 5.2) and 99.65% for LPV200 (section 5.3).

The performance at all airports with approach operations based on the APV-I or LPV200 service levels (Annex B and Annex C) presented Availability and Continuity values in line with their respective commitments as defined in the SoL SDD [RD-2] except for:

- **APV-I:** 1 airport LRJA / IASI/Iasi (Romania) in Continuity.

The Horizontal Safety Index remained below 0.34 and Vertical Safety Index remained below 0.35 for both APV-I (section 5.2.3) and LPV200 (section 5.3.3) service levels at all the analysed sites, which represents a good integrity margin.

NPA Availability above 99% (section 5.1.1) was delivered in the 100% of the NPA service area (limited by the boundaries defined by MT27).

Open Service

The monitored stations presented an Open Service Availability higher than 99% for this month (section 4).

The horizontal and vertical accuracy results for all the sites remained below 3 meters (95% HPE) and 4 meters (95% VPE) respectively.

EDAS Service

In terms of availability and latency, the observed performance for all the EDAS services fulfilled the targets (section 6) [RD-3].

ESMAS Service

The EGNOS SoL assisted service for Maritime Users (ESMAS) SiS commitment is based on a SiS availability of 99.8% (as described in ESMAS SDD [RD-4]). SiS combined availability this month has been 99.19%.

¹The coverage percentages presented represent the ratio of area after applying the mapping projection, there may be a difference compared to the actual geographical area.

² The value considering the period without SoL service from 13th to 17th October is 0% for both APV-I and LPV200 availability (99%).

EGNOS Time Service

The EGNOS Time Service availability presented for the combination of both operational GEOs was 100% during all month, except for 13/10/2025.

The offset between the EGNOS Network Time and GPS time remained below 26 nanoseconds over the three previous months: July to September 2025.

3 EGNOS SIS AVAILABILITY

In this document, **EGNOS SIS Availability** is defined as the percentage of time in the month during which at least one geostationary satellite broadcasts EGNOS messages.

In addition to the individual SIS Availability for PRN121 and PRN136, the following values are also reported:

- percentage of time in the month during which at least one geostationary satellite broadcasts EGNOS messages (PRN121 or PRN136);
- percentage of time in the month during which both operational geostationary satellites broadcast EGNOS messages.

EGNOS SIS monitoring for October 2025, reports the following reception percentage of an SBAS message:

• SIS – PRN121 or PRN136:	99.19%
• SIS – PRN121 and PRN136:	99.05%
• PRN121 Availability:	99.07%
• PRN136 Availability:	99.17%

The following Figure 1 presents the Availability of the signal in both EGNOS GEO satellites (PRN121 and PRN136). Red lines correspond to unavailability periods.

Figure 1 - EGNOS SIS & PRN Availability for October 2025³

Figure 2 – Trend of EGNOS SIS Availability per GEO for the past 6 (in green PRN 136; in purple PRN 121 until 8th September and PRN 121 from September 9th)

³ SIS availability values are lower than in previous months due to an EGNOS signal outage that occurred on October 13th.

Availability (%)	2025-05	2025-06	2025-07	2025-08	2025-09	2025-10
PRN123 until 08-25 and PRN121 from 09-25	99.96	99.96	99.98	99.99	99.99	99.07
PRN136	99.99	99.99	99.98	99.99	99.96	99.17
At least one EGNOS GEO satellite	100	100	100	100	100	99.19

Table 1 – EGNOS SIS Availability (%) on EGNOS GEO satellites

4 EGNOS OPEN SERVICE (OS)

4.1 Open Service Horizontal and Vertical Accuracy

Accuracy is a measure of the position error, which is the difference between the estimated navigation position and the actual position.

EGNOS OS Horizontal (resp. Vertical) Accuracy is reported as the 95th percentile of the Horizontal (resp. Vertical) Navigation System Error – HNSE (resp. VNSE) over the month, at the monitored sites when applying EGNOS messages.

The Table 2 provides the values of accuracy (95%) in meters measured for this month. See Annex A for details of the stations where OS Accuracy is reported.

Station	HNSE 95% (m)	VNSE 95% (m)
Aalborg	0.8	1.3
Berlin	0.9	1.4
Catania	1.0	2.0
Cork	1.0	1.3
Warsaw	1.0	1.3
Egilsstadir	1.0	1.9
Glasgow	0.9	1.5
Lisboa	1.3	1.7
Swanwick	1.1	1.5
Malaga	1.2	1.7
Kirkenes	1.2	2.1
Palma de Mallorca	1.0	1.6
Reykjavik	1.3	2.3
Roma	0.9	1.7
Lappeenranta	0.9	1.6
Santiago de Compostela	1.0	1.4
Sofia	1.2	1.6
Gavle	0.8	1.6
Toulouse	0.9	1.4
Trondheim	1.0	1.7
Tromsoe	1.2	2.1
Zurich	0.9	1.4
Jan Mayen	1.6	2.5
Athens	0.9	1.9
Kuusamo	1.0	1.9

Table 2 - EGNOS Open Service accuracy(95%)

The Figure 3 and Figure 4 show the histograms and cumulative distribution functions of HNSE (Horizontal Navigation System Error) and VNSE (Vertical Navigation System Error) computed at the RIMS listed in Table 2 for each second of the reported month.

Figure 3 – EGNOS Open Service HNSE Histogram and Cumulative Probability in October 2025

Figure 4 – EGNOS Open Service VNSE Histogram and Cumulative Probability in October 2025

4.2 EGNOS Open Service Availability

EGNOS OS Availability performance is defined in the present document as the percentage of time when the instantaneous HNSE is lower than 3 meters and the instantaneous VNSE is lower than 4 meters over the total number of samples with valid PA navigation solution.

The following Figure 5 presents the Open Service Availability measured by the monitoring stations for the reported month (RIMS sites with OS Availability lower than 99%, if any, are in red and RIMS sites with no data are in blue). See Annex A for further details of the stations where OS Accuracy is reported.

Figure 5 – EGNOS Open Service Availability at reference stations in October 2025

It is noted that Open Service was not available during 6 hours on 13th October due to lack of Signal in Space. During this period no EGNOS position could be computed. Refer to [EGNOS SN #35](#) for further details.

5 EGNOS SAFETY-OF-LIFE SERVICE (SOL)

During the month of October, EGNOS SoL and OS Services were impacted by a total loss of SiS occurring on Monday, 13 October 2025. EGNOS OS was recovered later that day, and EGNOS SoL was recovered on Friday, 17 October 2025 ([EGNOS SN #35](#)). To ensure that this section reflects the real EGNOS performance during the remaining days of the month, these five days have been excluded from all analyses and figures.

5.1 EGNOS Non-Precision Approach (NPA)

5.1.1 EGNOS NPA Availability

EGNOS NPA Availability is defined as the percentage of samples in which the Horizontal Protection Level is below Alert Limit for NPA (HPL below 556m) over the total period. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The Figure 6 presents EGNOS NPA Availability over the reported month. It must be noted that NPA Availability considering RAIM is not considered in this report.

Figure 6 – EGNOS NPA Availability in October 2025 (Excluding data from the 13th to the 17th of October)

5.1.2 EGNOS NPA Continuity

EGNOS NPA Continuity is reported as the result of dividing the total number of single continuity events using a time-sliding window of 1 hour by the number samples with valid and available NPA navigation solution. A single continuity event occurs if the system is available at the start of the operation and in at least one second inside the following time-sliding window of 1 hour the system becomes not available. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The Figure 7 presents the EGNOS NPA Continuity Risk measured for the last 6 months (in order to observe the minimum NPA Continuity performance committed in the SoL SDD $-1 \times 10^{-3}/\text{hour}$ -, at least 6 months of data need to be evaluated due to the discrete nature of discontinuity events). It must be noted that NPA Continuity is computed in this report using only the EGNOS NPA solution and not considering the GPS RAIM solution when the EGNOS one is not available.

Figure 7 – EGNOS NPA Continuity over the last 6 months (Excluding data from the 13th to the 17th of October)

5.1.3 EGNOS NPA Integrity Events

EGNOS NPA Integrity Event is defined as an event when the Navigation System Error is greater or equal to the corresponding Protection Level for NPA.

No integrity event was detected during the reported month.

Safety Index is defined as the relation between Navigation System Error and Protection Level (assuming NPA algorithms to compute $xNSE$ and xPL) for each second. Case of ratio $xNSE/xPL$ is over 1, it indicates that a Misleading Information situation has occurred.

The Figure 8 shows the distribution of HSI (Horizontal Safety Index), which is computed at the different EGNOS stations for each second over the reported month. This histogram considers the epochs in which the NPA service was available (Protection Level < NPA Alarm Limit).

Figure 8 – EGNOS NPA Horizontal Safety Index in October 2025 (Excluding data from the 13th to the 17th of October)

5.1.4 EGNOS NPA Accuracy

EGNOS NPA Accuracy is reported as the 95th percentile of the Horizontal Navigation System Error (HNSE) over the month, at the monitored sites when the NPA service is available (HPL below 556 m).

The Table 3 shows the NPA Accuracy values in meters. See Annex A for further details of the stations where NPA Accuracy is reported.

Station	HNSE 95% (m)	% of samples in NPA available
Aalborg	0.8	100%
Azores	2.7	100%
Berlin	1.0	100%
Canary Islands	6.6	100%
Catania	1.1	100%
Cork	1.0	100%
Warsaw	1.0	100%
Djerba	3.0	100%
Egilsstadir	1.0	100%
Glasgow	0.9	100%
Golbasi	1.0	100%
Lisboa	1.3	100%
Swanwick	1.1	100%
Madeira	3.2	100%
Malaga	1.4	100%
Kirkenes	1.2	100%
Palma de Mallorca	1.0	100%
Reykjavik	1.2	100%
Roma	0.9	100%
Lappeenranta	0.9	100%
Santiago de Compostela	1.0	100%
La Palma	6.4	100%
Sofia	1.2	100%
Gavle	0.8	100%
Toulouse	1.0	100%
Trondheim	1.0	100%
Tromsø	1.2	100%
Zurich	0.9	100%
Agadir	6.7	100%
Jan Mayen	1.6	100%
Athens	0.9	100%
Kuusamo	1.0	100%

Table 3 - EGNOS NPA Horizontal Accuracy (95%) and percentage of time in NPA available (Excluding data from the 13th to the 17th of October)

The following Figure 9 shows the histogram and cumulative probability function of HNSE (Horizontal Navigation System Error) computed at RIMS sites listed in Table 3 for each second of the reported month.

Figure 9 – EGNOS NPA HNSE Histogram and Cumulative Probability in October 2025 (Excluding data from the 13th to the 17th of October)

5.2 EGNOS Approach with Vertical guidance (APV-I)

5.2.1 EGNOS APV-I Availability

EGNOS APV-I Availability is defined as the percentage of epochs in a month in which the Protection Level are below Alert Limits for this APV-I service ($HPL < 40m$ and $VPL < 50m$) over the total period. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The following Figure 10 presents the EGNOS APV-I Availability over the reported month using GEO-combined maps for the operational EGNOS GEOs.

Figure 10 – EGNOS APV-I Availability in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 11 here below presents the evolution of the daily APV-I Availability (99%) compliance area. The percentage is computed with respect to ECAC Landmasses as specified in the EGNOS Safety of Life SDD [RD-2]. The information is presented for the last 3 months.

Figure 11 – EGNOS APV-I Availability compliance trend (compliance area percentage with regards to ECAC landmasses)

5.2.2 EGNOS APV-I Continuity Risk

EGNOS APV-I Continuity Risk is defined as the result of dividing the total number of single continuity events using a time-sliding window of 15 seconds by the number of samples with valid and available APV-I navigation solution. A single continuity event occurs if the system is available at the start of the operation and in at least one of the following 15 seconds the system becomes not available. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The following Figure 12 presents the EGNOS APV-I Continuity over the reported month using GEO-combined maps for the operational EGNOS GEOs.

Figure 12 – EGNOS APV-I Continuity in October 2025 (Excluding data from the 13th to the 17th of October)

5.2.3 EGNOS APV-I Integrity

EGNOS APV-I Integrity Event is defined as an event when the Navigation System Error is greater or equal to the corresponding Protection Level for APV-I.

No integrity event was detected during the reported month.

Safety Index is defined as the relation between Navigation System Error versus Protection Level (assuming PA algorithms to compute $xNSE$ and xPL) for each second. In case of ratio xPE/xPL is over 1; it indicates that a Misleading Information situation has occurred.

The Figure 13 and Figure 14, here after, provide the histogram for HSI (Horizontal Safety Index) and VSI (Vertical Safety Index) for each second when accumulating measurements from the different EGNOS stations over the reported month. Only those samples whose Protection Level is below the APV-I Alarm Limit have been considered in the histograms.

Figure 13 – EGNOS APV-I Horizontal Safety Index in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 14 – EGNOS APV-I Vertical Safety Index in October 2025 (Excluding data from the 13th to the 17th of October)

5.2.4 EGNOS APV-I Accuracy

EGNOS APV-I Accuracy is reported as the 95th percentile of the Horizontal and Vertical Navigation System Error over the month, at the monitored sites when the APV-I service is available (HPL<40m and VPL<50m).

The following Table 4 shows the monthly APV-I Accuracy values in meters for the combined GEO satellite signal. See Annex A for further details of the stations where APV-I Accuracy is reported.

Station	HNSE 95% (m)	VNSE 95% (m)	% of samples with APV-I service available
Aalborg	0.8	1.4	100%
Berlin	1.0	1.4	100%
Catania	1.0	2.0	100%
Cork	1.0	1.3	100%
Warsaw	1.0	1.3	100%
Djerba	1.5	1.9	99.11%
Egilsstadir	1.0	1.9	99.85%
Glasgow	0.9	1.5	100%
Golbasi	1.0	2.1	99.58%
Lisboa	1.3	1.7	100%
Swanwick	1.1	1.5	100%
Madeira	1.9	1.8	96.82%
Malaga	1.2	1.8	99.94%
Kirkenes	1.1	2.1	99.75%
Palma de Mallorca	1.0	1.6	100%
Reykjavik	1.2	2.2	99.55%
Roma	0.9	1.7	100%
Lappeenranta	0.9	1.6	100%
Santiago de Compostela	1.0	1.4	100%
Sofia	1.2	1.7	99.95%
Gavle	0.8	1.6	100%
Toulouse	1.0	1.4	100%
Trondheim	1.0	1.7	100%
Tromsoe	1.2	2.1	99.73%
Zurich	0.9	1.4	100%
Jan Mayen	1.6	2.5	99.77%
Athens	0.9	1.9	100%
Kuusamo	1.0	1.9	100%

**Table 4 - EGNOS APV-I Accuracy (95%) and percentage of time in APV-I mode at reference stations
(Excluding data from the 13th to the 17th of October)**

The Figure 15 and Figure 16, here after, show the histogram and cumulative distribution function of HNSE (Horizontal Navigation System Error) and VNSE (Vertical Navigation System Error) computed at the RIMS listed in Table 4 for each second of the reported month.

Figure 15 – EGNOS APV-I HNSE Histogram and Cumulative Probability in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 16 – EGNOS APV-I VNSE Histogram and Cumulative Probability in October 2025 (Excluding data from the 13th to the 17th of October)

5.2.5 EGNOS APV-I Performance at airports

For the reported month, the Availability at airports with EGNOS-based procedures for APV-I services shown in Figure 17 and the number of outages is shown in Figure 18.

Figure 17 – EGNOS APV-I Availability at airports in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 18 – EGNOS APV-I outages in October 2025 (Excluding data from the 13th to the 17th of October)

See Annex B for details of the APV-I Availability and Continuity at airports with published procedures using EGNOS.

5.3 EGNOS Localizer Performance with Vertical Guidance to a decision altitude of 200ft (LPV-200)

5.3.1 EGNOS LPV-200 Availability

EGNOS LPV-200 Availability is defined as the percentage of epochs in a month in which the Protection Level are below Alert Limits for this LPV-200 service ($HPL < 40m$ and $VPL < 35m$) over the total period. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The following Figure 19 presents the EGNOS LPV-200 Availability over the reported month using GEO-combined maps for the operational EGNOS GEOs.

Figure 19 – EGNOS LPV-200 Availability in October 2025 (Excluding data from the 13th to the 17th of October)

Below, the evolution of the daily LPV200 Availability (99%) compliance area is presented. The percentage is computed with respect to ECAC Landmasses as specified in the EGNOS Safety of Life SDD [RD-2]. The information is presented for the last 3 months.

Figure 20 – EGNOS LPV-200 Availability compliance trend (compliance area percentage with regards to ECAC landmasses)

5.3.2 EGNOS LPV-200 Continuity Risk

EGNOS LPV-200 Continuity Risk is defined as the result of dividing the total number of single continuity events using a time-sliding window of 15 seconds by the number of samples with valid and available LPV-200 navigation solution. A single continuity event occurs if the system is available at the start of the operation and in at least one of the following 15 seconds the system becomes not available. This value corresponds to the performance obtained under fault-free conditions using all satellites in view.

The following Figure 21 presents the EGNOS LPV-200 Continuity over the reported month using GEO-combined maps for the operational EGNOS GEOs.

Figure 21 – EGNOS LPV-200 Continuity⁴ in October 2025 (Excluding data from the 13th to the 17th of October)

5.3.3 EGNOS LPV-200 Integrity

EGNOS LPV-200 Integrity Event is defined as an event when the Navigation System Error is greater or equal to the corresponding Protection Level for LPV-200.

No integrity event was detected during the reported month.

Safety Index is defined as the relation between Navigation System Error versus Protection Level (assuming PA algorithms to compute $xNSE$ and xPL) for each second. In case of ratio xPE/xPL is over 1; it indicates that a Misleading Information situation has occurred.

The Figure 22 and Figure 23, here after, provide the histograms for HSI (Horizontal Safety Index) and VSI (Vertical Safety Index) for each second when accumulating measurements from the different EGNOS stations over the reported month. Only those samples whose Protection Level is below the LPV-200 Alarm Limit have been considered in the histograms.

⁴ The lack of additional performance levels in grey areas is due to the non-compliance in this region with the accuracy requirements imposed to LPV-200 service level. For more details, please refer to section 6.3.3.1 of the EGNOS Safety of Life SDD [RD-2].

Figure 22 – EGNOS LPV-200 Horizontal Safety Index in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 23 – EGNOS LPV-200 Vertical Safety Index in October 2025 (Excluding data from the 13th to the 17th of October)

5.3.4 EGNOS LPV-200 Accuracy

EGNOS LPV-200 Accuracy is reported as the 95th percentile of the Horizontal and Vertical Navigation System Error over the month, at the monitored sites when the LPV-200 service is available (HPL<40m and VPL<35m).

The following Table 5 shows the monthly LPV-200 Accuracy values in meters for the combined GEO satellite signal. See Annex A for further details of the stations where LPV-200 Accuracy are reported.

Station	HNSE 95% (m)	VNSE 95% (m)	% of samples with LPV-200 service available
Aalborg	0.8	1.4	100%
Berlin	1.0	1.4	100%
Catania	1.0	2.0	100%
Cork	1.0	1.3	100%
Warsaw	1.0	1.3	100%
Djerba	1.5	1.9	98.94%
Egilsstadir	1.0	1.9	99.71%
Glasgow	0.9	1.5	100%
Golbasi	1.0	2.1	99.25%
Lisboa	1.3	1.7	99.95%
Swanwick	1.1	1.5	100%
Malaga	1.2	1.8	99.89%
Kirkenes	1.1	2.0	99.20%
Palma de Mallorca	1.0	1.6	100%
Reykjavik	1.2	2.1	98.24%
Roma	0.9	1.7	100%
Lappeenranta	0.9	1.6	100%
Santiago de Compostela	1.0	1.4	100%
Sofia	1.2	1.7	99.95%
Gavle	0.8	1.6	100%
Toulouse	1.0	1.4	100%
Trondheim	1.0	1.7	100%
Tromsoe	1.1	2.1	99.74%
Zurich	0.9	1.4	100%
Jan Mayen	1.6	2.5	99.54%
Athens	0.9	1.9	99.97%
Kuusamo	1.0	1.9	99.81%

Table 5 – EGNOS LPV-200 Accuracy (95%) and percentage of time in LPV-200 mode at reference stations (Excluding data from the 13th to the 17th of October)

The Figure 24 and Figure 25, here after, show the histogram and cumulative distribution function of HNSE (Horizontal Navigation System Error) and VNSE (Vertical Navigation System Error) computed at the RIMS sites of Table 5 for each second of the reported month.

Figure 24 – EGNOS LPV-200 HNSE Histogram and Cumulative Probability in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 25 – EGNOS LPV-200 VNSE Histogram and Cumulative Probability in October 2025 (Excluding data from the 13th to the 17th of October)

The following Figure 26 displays the maximum LPV-200 VNSE registered at the RIMS sites of Table 5 during the period from 1st to 31st October 2025. All RIMS are compliant with the instantaneous 10m threshold to detect Accuracy Major Events.

Figure 26 – EGNOS LPV-200 VNSE Maximum Values (Excluding data from the 13th to the 17th of October)

5.3.5 EGNOS LPV-200 Performance at airports

For the reported month the Availability at airports with EGNOS-based procedures for LPV-200 service is shown in Figure 27 and the number of outages is shown in Figure 28

Figure 27 – EGNOS LPV-200 Availability at airports in October 2025 (Excluding data from the 13th to the 17th of October)

Figure 28 – EGNOS LPV-200 outages in October 2025 (Excluding data from the 13th to the 17th of October)

See Annex C for details of the LPV-200 Availability and Continuity at airports with published procedures using EGNOS.

6 EGNOS DATA ACCESS SERVICE (EDAS)

EDAS (EGNOS Data Access Service) offers internet-based access to EGNOS data [RD-3]. It is the single point of access for the data collected and generated by the EGNOS infrastructure composed of ground stations distributed over Europe and North Africa.

The main data provided by EDAS are:

- Raw GPS, GLONASS and EGNOS GEO observations and navigation data collected by the entire network of Ranging and Integrity Monitoring Stations (RIMS) and Navigation Land Earth Stations (NLES).
- EGNOS augmentation messages, as normally received by users via the EGNOS Geostationary satellites.

These data are provided through different EDAS Services, and in different formats, to satisfy the complete set of applications and needs. For a description of the EDAS services, please refer to the EDAS SDD [RD-3].

Additional information on the EDAS services is available in the EDAS section of the EDAS User Support website (<https://edas-maritime.gsc-europa.eu>) including the [EDAS services status in real-time](#).

Table 6 presents the performance of EDAS Services (please refer to the EDAS SDD [RD-3] for definition details) corresponding to October 2025:

- Availability: Percentage of time during which the service provides the data according to the specifications.
- Latency: Average of the percentile 95% latencies monitored for every 5 minutes period within the month.

EDAS Service		Availability	Latency (ms)
Service Level 0	-	100.00%	597.45
Service Level 2	-	100.00%	599.58
Ntrip Service	-	100.00%	583.77
SISNeT Service	GEO Operational 1	100.00%	56.42
	GEO Operational 2	100.00%	56.39
Data Filtering Service	RIMS A	99.88%	561.03
	Central	99.88%	526.33
	MEDA	99.88%	509.16
	North-East	99.88%	187.90
	North-West	99.87%	512.35
	South-West	99.88%	552.84
FTP Service	-	100.00%	N/A

Table 6 – Performance of EDAS Services

The EDAS SISNeT and FTP services were affected by the EGNOS service outage occurred on October 13th, with impact in GEOs data accessibility, not affecting the availability of the services. In addition, the Data Filtering availability figures reported in the table above were affected by an unplanned service interruption on October 23rd.

7 EGNOS TIME SERVICE

The EGNOS Time Service supports timing application by providing specific corrections that allow the tracing of EGNOS Network Time (ENT) to the physical realisation of the Coordinated Universal Time by Observatoire de Paris, UTC.

The **EGNOS Time Service Availability⁵** is computed as the percentage of time per day in which it is possible to obtain the time solution referred to UTC scale by applying a valid offset between the EGNOS Network Time (ENT) and the UTC scale, provided through the EGNOS Message Type 12.

The EGNOS Time Service availability presented for the combination of both operational GEOs was 100% during all month.

Figure 29 – EGNOS Time Service Availability in October 2025

The EGNOS Network Time is computed assuring its alignment with the GPS timescale. Due to this requirement, the offset between both timescales is below 50ns. The Figure 30 shows the relative consistency of both ENT and GPS timescales for the three months before the reported months, i.e., from July to September 2025. It can be observed that the offset between them remains below 26 nanoseconds.

⁵EGNOS Time Service Availability is computed taking into account that it is not possible to obtain the time solution if the navigation solution cannot be computed. Therefore, if a SiS outage longer than 3 seconds happens the MT12 data will be set as invalid in order to simulate the unavailability of the receiver to compute the PVT solution and no Time Service will be available until a new valid MT12 is received. In order to take into account the user capability of switching from one operational GEO to the other in case of SiS outage, the EGNOS Time Service availability is computed over the combination of both GEOs.

Figure 30 – ENT-GPS offset evolution from July to September 2025 (red square PRN 121; red circle PRN136; blue PRN 123)

Annex A Receiver Monitoring network

The receiver network used to report EGNOS performances in this document is based on the EGNOS monitoring stations (RIMS).

The map of Figure 31 shows the location of this receiver monitoring network, used in this report to present the EGNOS performances:

Figure 31 – EGNOS RIMS sites used in this report⁶

The stations in green are used to report LPV-200, APV-I, NPA and Open Service results.

The stations in blue are used to report LPV-200, APV-I and NPA results.

The stations in yellow are used to report APV-I and NPA results.

The stations in red are used to report NPA results.

In Table 7, the name and location of each one of the stations is reported along with the service for which they are used.

⁶RIMS Haifa is not operational since October 2023 and the asset will remain in that state until further notice.

Table 8 - Monthly APV-I Availability at airports with published procedures using EGNOS in October 2025 (Excluding data from the 13th to the 17th of October)

Annex C EGNOS LPV-200 Performance at airports

The Table 9 reports LPV-200 Availability and Continuity at airports with published procedures using EGNOS. These values correspond to the performance obtained under fault-free conditions using all satellites in view:

Airports	Country	Monthly LPV200 Availability	Monthly LPV200 Continuity Risk	Outages	Publication date of first LPV200 procedure	LPV200 Availability since procedure publication	LPV200 Continuity Risk since procedure publication
EBAW / Antwerpen	Belgium	100.00%	0.00e+00	0	02/11/2023	99.98%	7.28e-06

Annex D List of acronyms

Acronym	Definition
APV	Approach with Vertical Guidance
ASN	Abstract Syntax Notation
ECAC	European Civil Aviation Conference
EDAS	EGNOS Data Access Service
EGNOS	European Geostationary Navigation Overlay Service
ENT	EGNOS Network Time
ESSP	European Satellite Services Provider
FTP	File Transfer Protocol
GEO	Geostationary Satellite
GNSS	Global Navigation Satellite System
GPS	Global Positioning System
HAL	Horizontal Alert Limit
HNSE	Horizontal Navigation System Error
HPE	Horizontal Position Error
HPL	Horizontal Protection Level
HSI	Horizontal Safety Index
LPV	Localizer Performance with Vertical guidance
MI	Misleading Information
MT27	Message Type 27
NA	Not Applicable/ Not Available
NLES	Navigation Land Earth Station
NPA	Non-Precision Approach
NTRIP	Networked Transport of RTCM via Internet Protocol
OP	Operation
OPS	Operations
OS	Open Service
PA	Precision Approach
PL	Protection Level
PRN	Pseudo-Random Noise
RAIM	Receiver Autonomous Integrity Monitoring
RD	Reference Document
RIMS	Ranging and Integrity Monitoring Station
RTCM	Radio Technical Commission for Maritime Services

Acronym	Definition
SBAS	Satellite-Based Augmentation System
SDD	Service Definition Document
SIS	Signal-In-Space
SL0	Service Level 0
SL2	Service Level 2
SoL	Safety of Life
UTC	Universal Time Coordinated
VAL	Vertical Alert Limit
VNSE	Vertical Navigation System Error
VPE	Vertical Position Error
VPL	Vertical Protection Level
VSI	Vertical Safety Index
